

Rubin 1999-0728

IN THE CLAIMS:

1. (Previously Presented) A method executed in an apparatus comprising the steps of:

to a corpus of communication sessions that is devoted to communications via a network terminal point that is associated with a customer, adding at least a portion of a communication session in which an individual that is communicating via said terminal point is a participant;

augmenting a list of search keywords to form an augmented keywords list based on (a) instructions from said individual obtained from an interactive session with said individual following said communication session, or (b) an artificial intelligence module that analyzes said communication session; and

processing said communication session by use of the augmented keyword list to find those of the keywords that are found in said communication, and indexing said communication session in accord, with the found keywords, in a database so as to permit subsequent searching through said database to find said at least a portion of said communication session in said stored corpus.

2. (Previously Presented) The method according to claim 1, further comprising the steps of converting voice information contained in said communication session into related text information.

3. (Previously Presented) The method according to claim 1, where said apparatus is on premises of said customer and said individual initiates said communication.

4. (Previously Presented) The method according to claim 3, where said step of augmenting comprises the steps of

prompting said individual to specify terms to be additionally used for said indexing; and

revising said list based on said terms specified by said individual.

5. (Previously Presented) The method according to claim 4, wherein said

Rubin 1999-0728

communication session comprises outgoing packets sent by said individual and incoming packets of another party.

6. (Previously Presented) The method according to claim 5, further comprising the step of:

determining whether explicit approval has been given by said other party to store said incoming packets.

7. (Previously Presented) The method according to claim 6, where said portion excludes said incoming packets of said other party.

8. (Previously Presented) The method according to claim 7, further comprising the step of:

determining whether said incoming packets for communications sent by said party are to be protected, and if so, protecting said incoming packets so that said individual cannot access said protected communication without an additional granting of permission by said party.

9. (Previously presented) The method according to claim 8, further comprising the step of appending said incoming packets to said corpus.

10. (Previously presented) The method according to claim 9, further comprising the step of:

appending to said corpus meta information and identification information related to said communication session.

11. (Canceled)

12. (Previously Presented) The method according to claim 1, further comprising the steps of:

searching said database to find a communication session according to search for a

Rubin 1999-0728

term provided by a user of said apparatus.

13. (Previously presented) The method according to claim 12, further comprising the step of:

reconstructing at least a portion of a communication session found by said step of searching; and

presenting said reconstructed selected communication session to said user for review.

14. (Previously Presented) A system including a personal computer (PC) situated in a non-commercial establishment and adapted to carry a communication session in which a person who is a member of said establishment is a participant via a network, characterized by:

a module that collects digitized information packets of said communication session and identifies keywords in text representing speech uttered during said communication session for populating a database, which keywords belong to a list that is augmented following said session through interaction with said person or through a process that involves artificial intelligence.

15. (Canceled) .

16. (Canceled) .

17. (Previously Presented) A broadband communication system, comprising:  
a personal communication module adapted for personal use by an individual to communicate with another party;

a collection module that collects and stores a communication session where said individual is one of the participants and excludes communication by said other party, and

an analysis module adapted to identify keywords contained in said stored communication, and create a database that associates said communication session with the keywords identified to be contained in said stored communication.

18. (Canceled) .
19. (Canceled) .
20. (Previously presented) The system according to claim 17, wherein said communication is a telephone call, and speech, by said individual is digitized and packetized.
21. (Previously presented) The system according to claim 17, further comprising a module for encrypting information originating from said another party.
22. (Canceled) .
23. (Previously presented) The system according to claim 17, wherein said collection module converts signal to be stored to text information when said signal represents voice.
24. (Previously Presented) The system according to claim 17 wherein said analysis module creates an indexed database that associates one or more of said keywords that are contained in said communication session with said communication session that is stored by said collection module.
25. (Previously Presented) The system according to claim 24, wherein the broadband communication system prompts said individual to determine preferred communication session identification terms and said keywords to be searched for in said communication session, and revises said identification terms and said keywords according to said preferred communication session identification terms and keywords.
26. (Previously presented) The system according to claim 25, wherein said digitized information packets includes outgoing packets for communications sent by said

Rubin 1999-0728

individual and incoming packets for communications sent to said individual by a party.

27. (Previously Presented) The system according to claim 26, wherein said personal communication module determines whether approval has been given by said party to store said incoming packets for communications sent by said party.

28. (Canceled) .

29. (Canceled) .

30. (Canceled) .

31. (Canceled) .

32. (Previously Presented) The system according to claim 17, wherein said collection module converts said voice information to text using voice/speech recognition;

and said analysis module selects keywords for which said communication is searched using artificial intelligence.

33. (Previously presented) The system according to claim 24, further comprising a search module that searches said database to find a communication session according to search terms provided by said individual.

34. (Previously presented) The system according to claim 33, wherein said search module reconstructs at least a portion of a communication session found by said search module from stored information and presents said reconstructed communication session to said individual for review.

35. (Previously Presented) The method of claim 1 where said at least a portion of a communication session is limited to information provided by those parties who

Rubin 1999-0728

participate in said communication session and who permit recording of their information.

36. (Previously Presented) The method of claim 35 where permission is granted by a party who participates in said communication session through an entry of a code.

37. (Previously Presented) The method of claim 36 where information provided by parties, other than said individual, who participate in said communication session is included in said at least a portion of a communication session in encrypted form.

38 (Previously Presented) The method of claim 1 where said step of selecting keywords is limited to keywords contained in information provided by those individuals who participate in said communication session and who permit recording of their information.

39. (Previously Presented) The method of claim 1, where information in said at least a portion of a communication session belongs solely to said individual.
